ŗ

New isolated nucleic acid encoding MP-1 protein, useful for preventing, treating, or ameliorating diseases associated with aberrant metalloproteinase activity, e.g. immune, metabolic, inflammatory and neurological disorders. neurological

Claim 5; Page 29; 473pp; English.

The invention describes an isolated nucleic acid molecule (I) encoding a metalloprotease (MP-1). (I) is useful for preventing, treating, or

The present invention also describes: (1) the preparation of the OSGPLP protein; (2) applying the OSGPLP protein in diagnosis; (3) the prevention and/or treatment of related diseases; (4) utilising the OSGPLP protein in screening its agonist, excitomotor and inhibitor and preparing an antibody against the OSGPLP protein, and (5) the use of the OSGPLP polynucleotide sequences, proteins, agonists, excitomotors, inhibitors and antibodies in treating diseases related to the abnormal OSGPLP gene and in preparing the medicine composite for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            O-sialogycoproteinase-like for diagnosing, preventing

The invention relates to an isolated polypeptide comprising: any of 28 sequences of 48-1256 amino acids; a natural amino acid sequence at least CC 90% identical to the 28 amino acids sequences, 94% identical to a sequence of 703 or 267 amino acids, 96% identical to a sequence of 414 amino acids, or 97% identical to a sequence of 242 amino acids, all given in CC the specification; or a biologically active or immunogenic fragment of CC the isolated polypeptide. The polypeptides and polymucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression of protein modification and maintenance CC molecules (PMOD), such as cell proliferative diseases (e.g. AIDS, CC allergies), neurological disorders (e.g. stroke, Parkinson's disease, epilepsy), gastrointestinal (e.g. ulcer, cirrhosis), reproductive (e.g. cendenctriosis), developmental (e.g. ulcer, cirrhosis), reproductive (e.g. cendenctriosis), developmental, vesicle trafficking disorders, and CC infections (e.g. bacterial, viral, parasitic, protozoal). These are also useful in assessing the effects of exogenous compounds on the expression of mucleic acid and amino acid sequences of PMOD. The PMOD or its Cragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the ctarget polynucleotide and compounds that specifically bind to or modulate the activity of the polypeptide. The microarray is useful in monitoring of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        22-JUN-2001; 2001US-0300508P.

The present invention relates to novel 38650, 28472, 5495, 65507, 81588 CC or 14354 nucleic acid molecules which encode adenosine deaminase, glyco-cc protease or seven transmembrane domain (77M) receptor family members. CC Sequences of the invention are useful in diagnosing and treating cancer or aberrant cellular proliferation and/or differentiation (e.g. colon or CC lung cancer), immune disorders (e.g. selective IgA deficiency, rheumatoid CC arthritis, diabetes, allergy), heart or cardiovascular disorders (e.g., hypertension, atherosclerosis, arrhythmias, ischaemic heart disease, CC myocardial infarction, thrombus including endothelial cell disorders (e.g., gsoriassis, Grave's disease), haematopoletic disorders, brain CC disorders (e.g. cerebral oedema, Parkinson's or Alzheimer's disease), CC gain and metabolic disorders (e.g. obesity), liver disorders or platelet CC disorders. They are also useful in screening assays, predictive medicine (e.g. diagnostic assays, propostic and therapeutic methods. The cultical cacids may also be used in chromosome mapping, tissue typing and CC canso in gene therapy. The present sequences of the invention are calso used in gene therapy. The present sequence is human glycoprotease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

cell proliferation; aberrant cell differentiation;

glycoprotease 28472.

breast cancer; ovarian cancer; prostate cancer; colon cancer; lung cancer; immune disorder; heart disorder; cardiovascular disorder; endothelial disorder; hematopoietic disorder; blood vessel disorder; brain disorder; pain; metabolic disorder; liver disorder; diabetes; platelet disorder; carcinoma; sarcoma; leukaemia; Hodgkin's disease; autoimmune disorder; hypertension, atherosclerosis; heart failure; myocardial infarction; ischaemic heart disease; Crohn's disease; grave's disease; Kawasaki syndrome; Raynaud's disease; aneurysm; cerebral ischaemia; peripheral neuropathy; Alzheimer's disease; enzyme.

```
CC 14354 nucleic acid molecules (I) and their encoded polypeptides (II). The CC 38650 nucleic acid molecule comprises a sequence encoding adenosine CC deaminase. The 28472 nucleic acid molecule comprises a sequence encoding adenosine CC deaminase. The 28472 nucleic acid molecule comprises a sequence encoding CC a human glycoprotease. The 5495, 65507, 81588 and 14354 comprises CC sequences that encode a human seven transmembrane domain (7TM). The CC sequences are useful for diagnosing, preventing or treating a subject CC with or at risk of developing a disorder, e.g. cancer or aberrant CC cellular proliferation and/or differentiation (e.g. breast, ovarian, CC prostate, colon or lung cancer), immune disorders, heart disorders, cardiovascular disorders, endothelial disorders, heart disorders, CC liver disorders or platelet disorders, pain and metabolic disorders, CC liver disorders or platelet disorders. These disorders include carcinoma, sarcoma, leukaemia, Hodgkin's disease, autoimmune disorders, Kawasaki CC syndrome, Raynand's disease, Crohn's disease, Grave's disease, Kawasaki CC syndrome, Raynand's disease, aneurysm, cerebral ischaemia, peripheral neuropathy, Alzheimer's disease, Parkinson's disease, anorexia nervosa, CC cachexia or diabetes. This is the amino acid sequence of the novel human

The invention relates to an isolated 38650 (encoding adenosine deaminase), 28472 (encoding a glycoprotease), 5495 (encoding a 7 transmembrane receptor), 65507, 81588 or 14354 nucleic acid molecule (or a sequence which is at least 60% identical to the six nucleic acids or their open reading frames, fragments of at least is nucleotides, naturally occurring variants, or a DNA insert of the plasmid deposited with the American Type Culture Collection as Accession No. not defined in the specification, which encodes the amino acid sequence). Also included are a host cell containing the nucleic acids (used to produce the

The nucleic acid molecules, polypeptides and methods are useful for diagnosing, treating cancer, aberrant cellular proliferation and/or differentiation, immune disorders, heart disorders, cardiovascular disorders including endothelial cell disorders, based disorders, blood vessel disorders, brain disorders, pain and metabolic disorders, liver disorders and platelet disorders (many examples of these disorders are given in the specification). The present sequence is the Human glycoprotease encoded by cDNA 28472
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; Anti-inflammatory; Osteopathic; Neuroprotective; Nootropic; Gene Therapy; human; secretory protein; membrane proteins; cancer; inflammatory disease; osteoporosis; neurological disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel human secretory or membrane proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotides encoding full-length polypeptides, e.g. secretory and/or membrane proteins, useful for developing medicines for disease which the gene is involved, or as target molecules for gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating-cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                   Region
                                                                                                                                                                                                                Region
                                                                                                                                                                                                                                              Region
                                                                                                                                                                                                                                                                                                                                                    ygjD protein; essential; Gram positive; Gram negative; identification; antagonist; antibacterial; antibiotic; treatment; infection; resistance; drug target.

These proteins are essential for the survival of both Gram negative and Gram positive bacteria, although no function has as yet been ascribed to these proteins. The ygjD proteins, fragments of ygjD proteins (for example, fragments encompassing one or more conserved ygjD motifs such as AAY52218-Y52284) and nucleotides encoding them can be used to identify antagonists and broad spectrum antibacterial compounds. These antagonists and compounds can be used to treat a wide range of bacterial infections. New antibiotics are urgently needed, as serious bacterial infections and antibiotic resistant strains are becoming increasingly prevalent. The proteins of the invention are essential proteins for bacterial viability, and represent new targets for antibiotics
